n.a. $\,$ n.a. database search, using Smith-Waterman algorithm with gap extension penalties as well as gap opening penalties

Fri Dec 25 06:17:41 1998; MasPar time 326.16 Seconds 543.181 Million cell updates/sec Run on:

Tabular output not generated.

>US-08-951-733-19 (1-3798) from US08951733.seq 3798

Description: Perfect Score: N.A. Sequence:

TABLE default Gap open 30; Gap extend 1 Scoring table:

Dbase 0; Query 0 Nmatch STD:

Post-processing:

88822 seqs, 23323279 bases x

Searched:

Minimum Match 0% Listing first 45 summaries

n-issued 1:5_COMB 2:PCT9_COMB 3:backfiles1 Database:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Mean 9.574; Variance 5.701; scale 1.679 Statistics:

Sequence 142, Application US/08471052A
Sequence 142, Application US/08471052A
Patent No. 5625033
GENERAL INFORMATION:
APPLICANT: Kowy N. K.
APPLICANT: Fowlkes, D. M.
TITLE OF INVENTION: Totally Synthetic Affinity Reagents
NUMBER OF SEQUENCES: 166
CORRESPONDENCE ADDRESS:
ADDRESSEE: Pennie & Edmonds
STREET: 1155 Avenue of the Americas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                STATE: New YOLK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Charlton, A.J.; Baxter, N.J.; Lilley, T.H.; Haslam, E.; McDonald, C.J.; Williamson, M.P.
Chorald, C.J.; Williamson, M.P.
Tannin interactions with a full-length human salivary proline-rich protein display a stronger affinity than with single proline-rich repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ģ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            #domain signal sequence #status predicted #label SIG\

#title Analysis of three nodD genes in Rhizobium leguminosarum
biovar phaseoli; nodDl is preceded by nolE, a gene whose
product is secreted from the cytoplasm.

PAM 150 Gap 11 Scoring table:

74019 segs, 26840295 residues Searched:

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

swiss-prot35 1:swissprot

Mean 55.898; Variance 96.260; scale 0.581 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A WARREN F.D., DRIER E.A., OPPERMANN H.;
J. BIOL. CHEM. 267.2520-25227(1992).
C.-1. FUNCTION: INDUCES CARTILAGE AND BONE FORMATION. MAY BE THE OSTEOINDUCTIVE FACTOR RESPONSIBLE FOR THE PHENOMENON OF EDITHELIAL OSTEOGENESIS. PLAYS A ROLE IN CALCIUM REGULATION AND BONE HOMEOSTAS. (SP. SIMILARITY).
C.-1. SUBUNIT: HOWODIMER, DESULFIDE-LIRRED.
C.-1. SUBUNIT: BELONGS TO THE TGF-BETA FAMILY.

Mean 54.168; Variance 101.474; scale 0.534 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                prods. for the diagnosis, prevention and treatment of associated diseases, e.g. cancer or neuro:degenerative disease.

Claim 22; Fig 9; 123pp; English.

Wi8663 and Wi8664 are +2 and +1 frameshift mutations, respectively, of a sequence comprising fragments of the coding sequence of the human neurofilament subunit NF-H gene corresponding to nucleotides.

Claim 1162 of the Wild-type NF-H gene. This region contains GACAG motifs.

Frameshift mutants of the tau, ubiquitin, apolioporotein E, microtubule-associated protein 2 (MPP-2), neurofilament subunit L, M and amyloid A4 genes are claimed. All these genes share a common CG dinucleotide deletion(s) that cause neurodegenerative disorders.

Chigenic peptides used for the production of antibodies, and small neurolectic acid sequences derived from frameshift mutants are used in the
                                                                                                                                             Fragmented human NF-H gene +1 frameshift mutant product.

New osteogenic polypeptide(s) and their dimeric proteins - useful in association with a matrix for bone reconstitution after orthopaedic and plastic surgery.

Disclosure; 51-53; 69pp; English.

The sequence encodes the prepro form of human osteogenic polypeptide-2 (hOP2-Pp). The protein is useful as a subunit of osteogenic proteins capable of endochondral bone formation, and allogenic and xenogenic implants in mammals. When implanted with a matrix, the polypeptide locally induces the full developmental cascade of endochondral bone formation on marrow differentiation. This can be used for optimal predictable bone formation to correct, egacquired or congenital cranofacial and other skeletal or dental anomalies, and to treat non-union fractures. The polypeptide also have dental and periodochial appliens, and may be used for cartilage
                                                                                                                                                              dental abnormality;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | :| ||:: :|||| : |:|||| | ::|

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treatment of chronic renal failure - using an osteogenic

Protein/Pone morphogenetic protein renal therapeutic agent or

Protein/Pone morphogenetic protein renal therapeutic agent or

morphogen or renal mesenchymal progenitor cells

This sequence represents the mouse osteogenic protein, OP-2. This

This sequence represents the mouse osteogenic protein, OP-2. This

Crisk of, chronic renal failure which comprises administering an

osteogenic protein/Done morphogenetic protein (OP/BMP) renal having, or at

crisk of, chronic renal failure which comprises administering an

osteogenic protein/Done morphogenetic protein (OP/BMP) renal therapeutic

agent or morphogen. The method can be used for treating e.g. chronic

agent or morphogen. The method can be used for treating e.g. chronic

clanal failures, end'stage renal disease, chronic diabetic apphropathy,

diabetic glomerulopathy, diabetic renal hypertrophy, hypertuphy,

administerion hypertrophy, tubular hypertrophy,

clinicated with e.g. glomerular hypertrophy, tubular hypertrophy,

clinicated with e.g. glomerular hypertrophy,

clinication agents can prevent, inhibit or delay the progressive loss of

functional nephron units and the progressive decline in glomerular

clinication rate (GFR) which slowly but inevitably leads to the need for

consistence.

The present sequence represents the present invention describes methods used in the present invention. The present invention describes methods used in the present invention. The present invention describes methods for selectively extracting an osteogenic protein (OP) from a mixture. The method comprises: (a) exposing the mixture to an antibody that specifically binds OP, separating the resulting antibody-protein complex from the mixture, and dissociating the complex. In the methods OP comprises a pair of oxidised subunits that are disulphide-bonded to form a dimer, and one of the subunits has an amino acid (aa) sequence sufficiently homologous to residues 335-431 of a 431 aa protein designated OPS, sequence given in the specification. In dimeric form OP is capable of inducing cartilage and endochondral bone formation in a mammal when disposed within a matrix implanted in the mammal. The methods are used for recovering the recombinant proteins from cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; osteogenic protein; hOP-1; murine; mOP-1; TGF-beta superfamily; transforming growth factor-beta; dimer; antibody; epitope; hippocampus; purification; implantable osteogenic device; bone formation; cranofacial; anomaly; skeletal; dental; endochrondral bone formation; oranofacial; non-union fracture; cartilage repair; osteoarthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        induce local endochrondral bone formation in non-union fractures and in other clinical applications including dental and periodontal applications where bone formation is required. Other potential applications include cartilage repair, e.g. in the treatment of osteoarthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antibodies with osteogenic protein binding specificity - used in purification of osteogenic proteins, and as antigenic proteins bulsclosure; column 139-42; 129pp; English.

This sequence represents the murine osteogenic protein, mOP-2. mOP-2 has homology with proteins in the TGF-beta superfamily. Fragments of the mOP-2 protein can be used in the production of dimeric peptides which may be used in the generation of antibodies with binding specificities for osteogenic proteins. The antibodies are and may be used in purification protocols. Osteogenic protein and may be used in minibulable osteogenic device which allows predictable bone formation to correct acquired and congenital cannot other skeletal or dental anomalias. They may be used to carnofacial and other skeletal or dental anomalias. They may be used to carnofacial and other skeletal or dental anomalias.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         glalcalggghgprpp-htc-pqrrlg-arerrdmqreilavlglpgr-prpragpaaar 67

The first properties of morphogenic-stimulating agent - to prevent bone loss or increase, used for treating bone fractures, post-menopausal or senile osteoporosis, hyperparathyroidism etc.

Disclosure; Page 122-123; 162pp; English.

The sequence is that of mouse osteogenic protein 2 (mOP-2) a morphogenically active protein which may be used as part of a morphogenically active protein which may be used as part of a morphogenically active protein which may be used as part of a morphogenically active protein which may be used so part of a morphogenically active protein which may be used so part of a morphogenically active protein which are been affected in skeletal reconstructure. Such diseases include chronic renal failure and other kidney diseases, osteomalacia, vitamin D deficiency-induced other kidney diseases, osteomalacia, vitamin D deficiency-induced other kidney diseases, osteomalacia, vitamin D deficiency-induced osteopenia or osteoporosis, postmenopausal females, aged individuals and individuals undergoing postmenopausal females, aged individuals and individuals undergoing dialysis. The loss of bone mass may result from an imbalance in bone resorption or bone formation, an imbalance of calcium or hormonally metabolism, a vitamin D imbalance or be nutritionally or hormonally

A novel mouse morphogenic protein, OP3, has the sequence given in R54934, and is encoded by CDNA of sequence 065390. CDNA and protein sequences were also provided for human osteogenic protein OP1 (065391, R54935), mouse OP1 (065392, R54936), human OP2 (065393, R54937) and mouse OP2 (065394, R54938), as well as the genomic DNA sequence of human OP2 (065395). Generic sequences given in R54939-40 accommodate homologies between OP1, OP2, OP3 and other morphogen Sequence 399 AA;

Murine osteogenic protein mOP2 and proteins having at least 70% homology with it are preferred morphogens for inclusion in new morphogen-enriched nutritional formulations. The formulations are dietary compositions suitable for people at risk for tissue damage due to protein energy malnutrition or to altered metabolism an infant or juvenile.
